

# Network models

- Network models define a set of network layers and how they interact.
- There are several different network models depending on what organization or company started them.

# Learning outcomes

- Understand the need of layering in Networked computing
- Understand the OSI model and the tcp/ip model
  - Understand the function protocols and their role at each layer.
    - TCP protocol
    - UDP protocol
- Understand the role of header in communication between layers
- Understand how data sent from one host arrive to the target host.

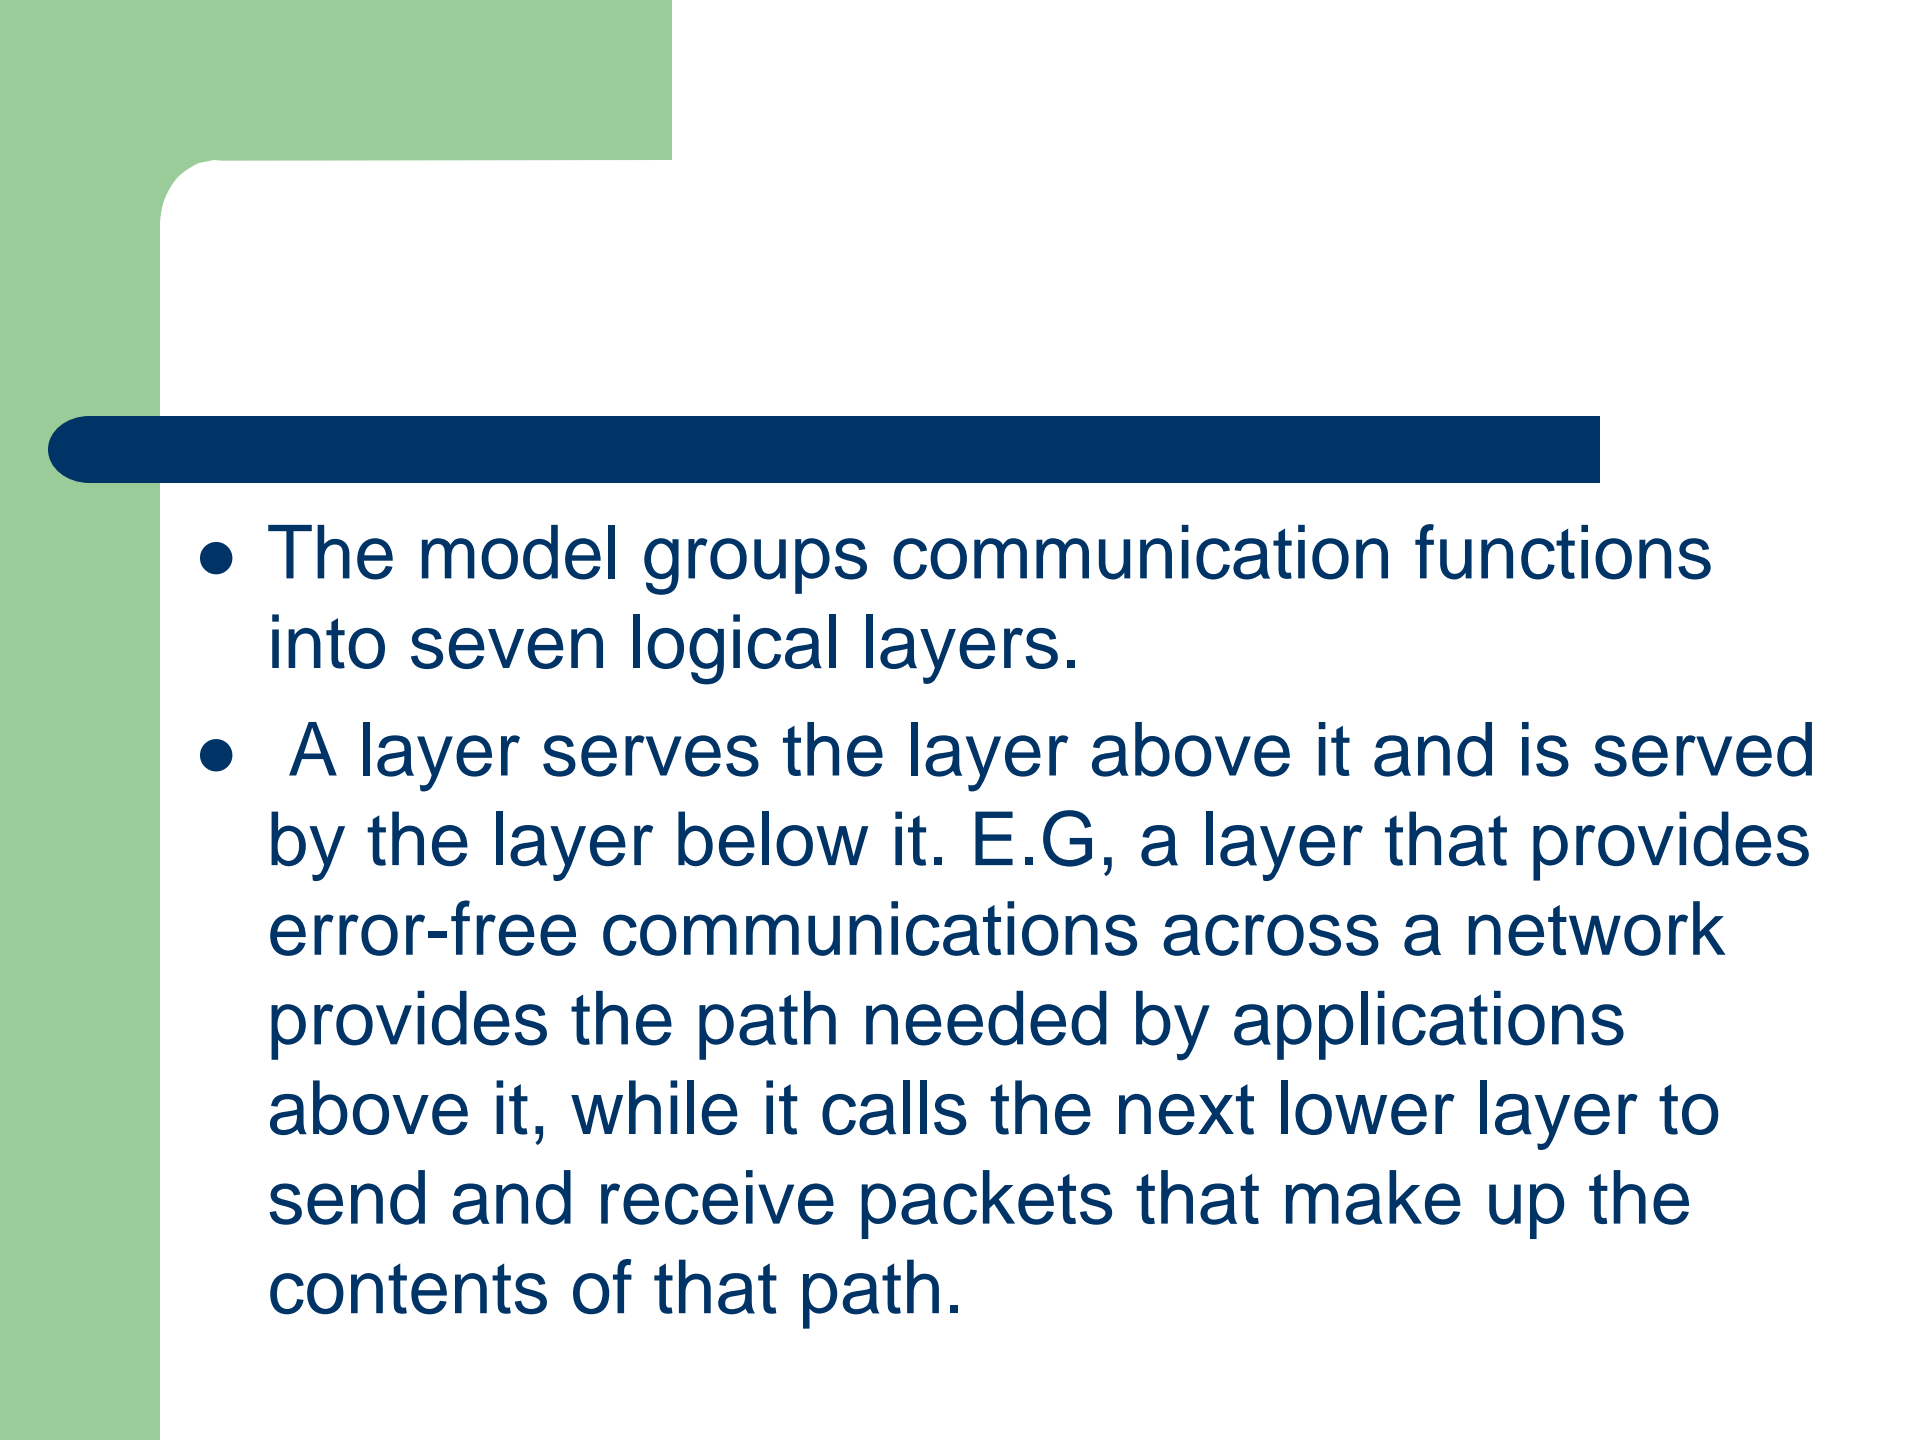

# Layering in Networked computing

---

- OSI Model
- TCP/IP Model
- Protocols at each layer

# OSI MODEL

- The OSI model is a conceptual model that characterizes and standardizes the internal functions of a communication system by partitioning it into abstraction layers.
- The model is a product of the Open Systems Interconnection project at the International Organization for Standardization (ISO),

- 
- The model groups communication functions into seven logical layers.
  - A layer serves the layer above it and is served by the layer below it. E.G, a layer that provides error-free communications across a network provides the path needed by applications above it, while it calls the next lower layer to send and receive packets that make up the contents of that path.

# What is layering in Networked computing?

---

- Breaks down communication into smaller, simpler parts.

# Why a layered model?

- Easier to teach communication process.
- Speeds development, changes in one layer does not affect how the other levels works.
- Standardization across manufactures.
- Allows different hardware and software to work together
- Reduces complexity

# The OSI Reference Model

---

**OSI**

# The OSI Model

- OSI “Open Systems Interconnection”.
- OSI model was first introduced in 1984 by the International Organization for Standardization (ISO).
  - Outlines **WHAT** needs to be done to send data from one computer to another.
  - Not **HOW** it should be done.
  - Protocols stacks handle how data is prepared for transmittal (to be transmitted)
- In the OSI model, The specification needed
  - are contained in 7 different layers that interact with each other.

# What is “THE MODEL?”

- Commonly referred to as the OSI reference model.
- The OSI model
  - is a theoretical blueprint that helps us understand how data gets from one user's computer to another.
  - It is also a model that helps develop standards so that all of our hardware and software talks nicely to each other.
  - It aids standardization of networking technologies by providing an organized structure for hardware and software developers to follow, to insure their products are compatible with current and future technologies.

# 7 Layer OSI Model

- Why use a reference model?
  - Serves as an outline of rules for how protocols can be used to allow communication between computers.
  - Each layer has its own function and provides support to other layers.
- Other reference models are in use.
  - Most well known is the TCP/IP reference model.
  - We will compare OSI and TCP/IP models
- As computing requirements increased, the network modeling had to evolve to meet ever increasing demands of larger networks and multiple vendors.
- Problems and technology advances also added to the demands for changes in network modeling.

# Evolution of the 7-Layers

- Single Layer Model - First Communication Between Computer Devices
  - Dedicated copper wire or radio link
  - Hardware & software inextricably intertwined
  - Single specification for all aspects of communication

# Evolution of the 7-Layers (1)

- Two Layer Model
  - **Problem:** Applications were being developed to run over ever-increasing number of media/signaling systems.
  - **Solution:** Separate application aspects from technical (signaling and routing) aspects
  - **Application Layer:** Concerned with user interface, file access and file transfer

# Evolution of the 7-Layers (3)

- Four Layer Model - Network connectivity inherently requires travel over intermediate devices (nodes)
- Technical Standards Level divided into Network, Data-link and Physical Layers

# Evolution of the 7-Layers (3) cont.

## Physical Layer

- Describes physical aspects of network: cards, wires, etc
- Specifies interconnect topologies and devices

- Network Layer

- Defines a standard method for operating between nodes
- Address scheme is defined (IP)
- Accounts for varying topologies

- Data-Link

- Works with Network Layer to translate logical addresses (IP) into hardware addresses (MAC) for transmission
- Defines a single link protocol for transfer between two nodes

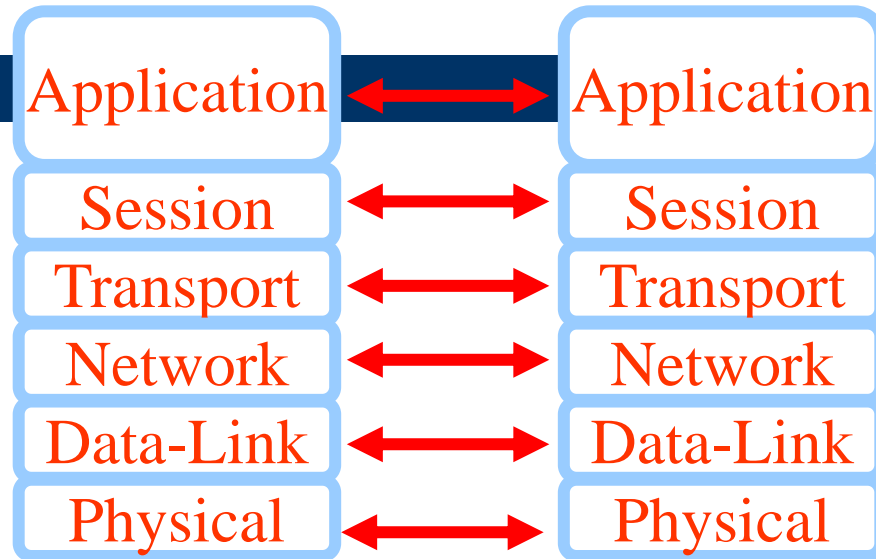

# Evolution of the 7-Layers (4)

- Five Layer Model – Increase Quality of Service (QOS)
  - Variable levels of data integrity in network
  - Additional data exchanges to ensure connectivity over worst conditions
  - Became the Transport Layer

# Evolution of the 7-Layers (5)

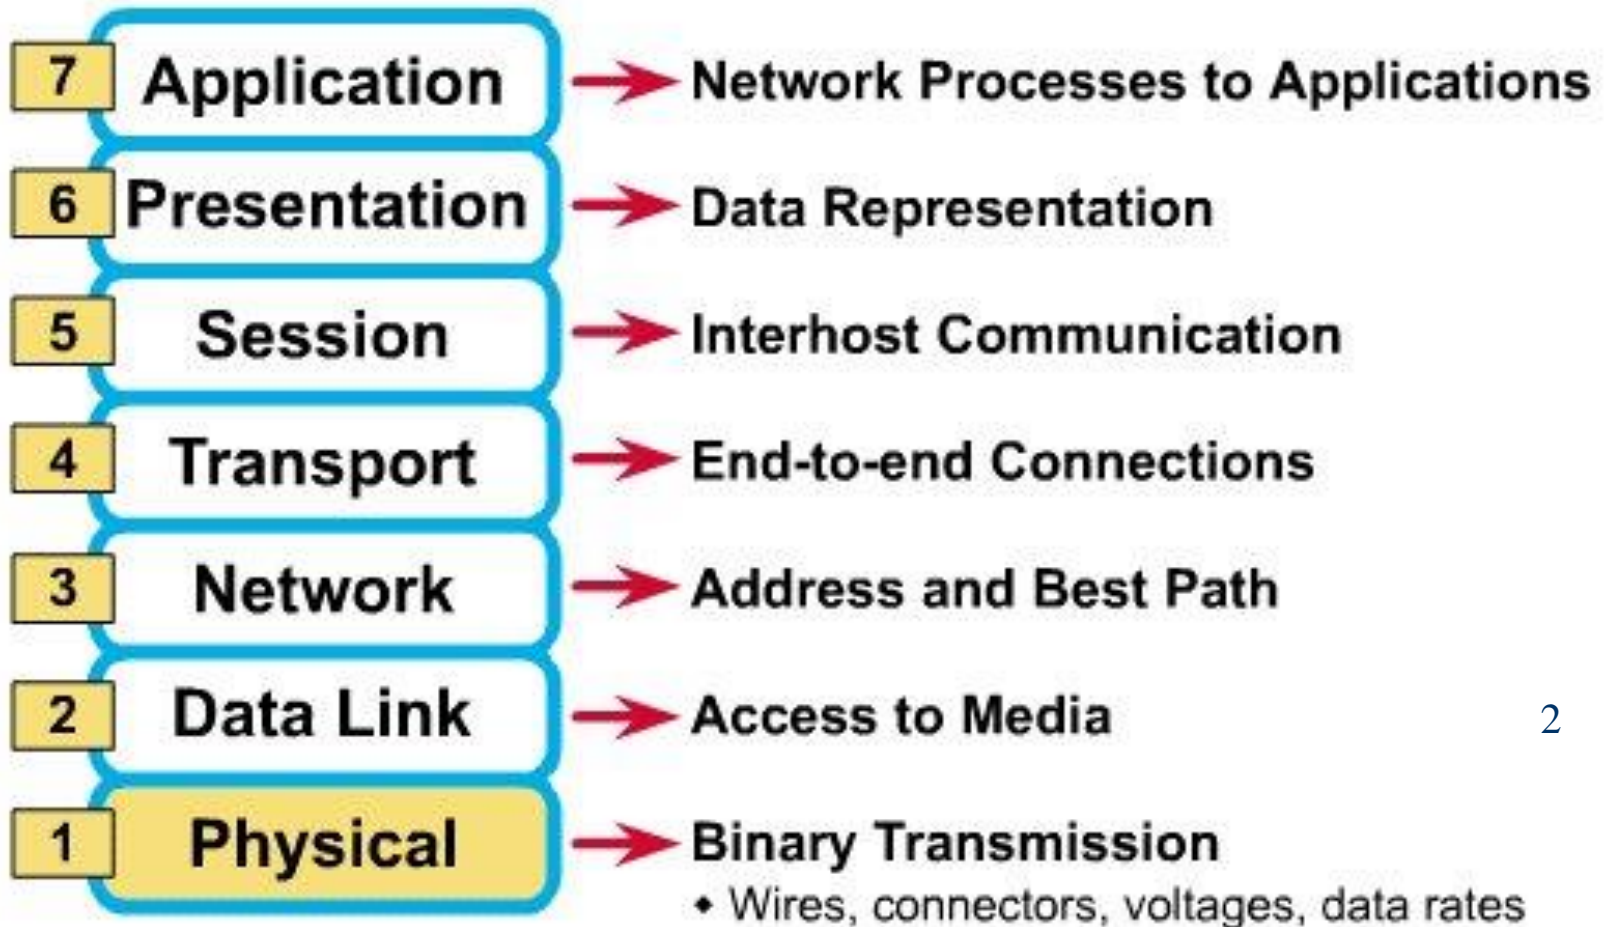

- Six Layer Model - Dialogue Control and Dialogue Separation
  - Means of synchronizing transfer of data packets
  - Allows for checkpointing to see if data arrives (at nodes and end stations)
  - Became Session Layer

# Evolution of the 7-Layers (6)

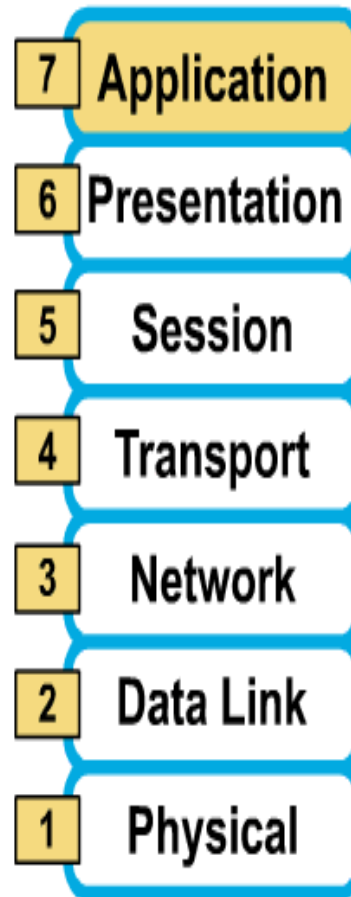

- The Seven Layer OSI Model - Addition of Management and Security
  - Standardizing notation or syntax for application messages (abstract syntax)<sup>1</sup>
  - Set of encoding rules (transfer syntax)
  - Became the Presentation Layer

# What Each Layer Does

# The 7 Layers of the OSI Model

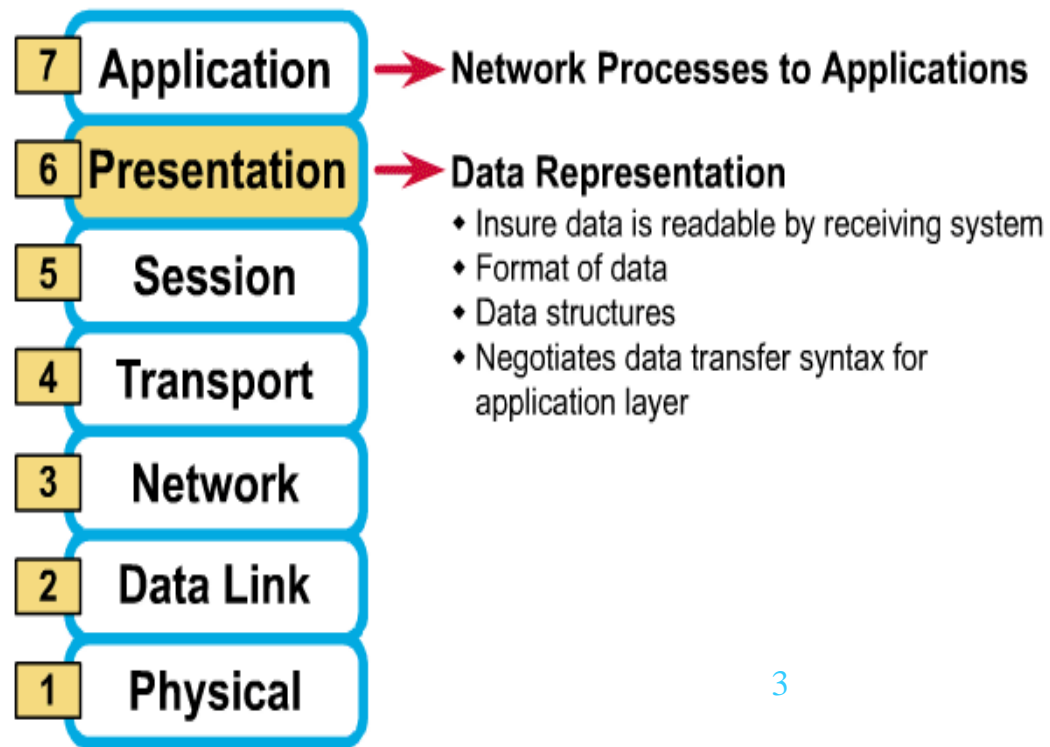

→ **Network Processes to Applications**

- ♦ Provides network services to application processes (such as electronic mail, file transfer, and terminal emulation)

- Gives end-user applications access to network resources
- Where is it on my computer?
  - Workstation or Server Service in MS Windows

# Presentation Layer

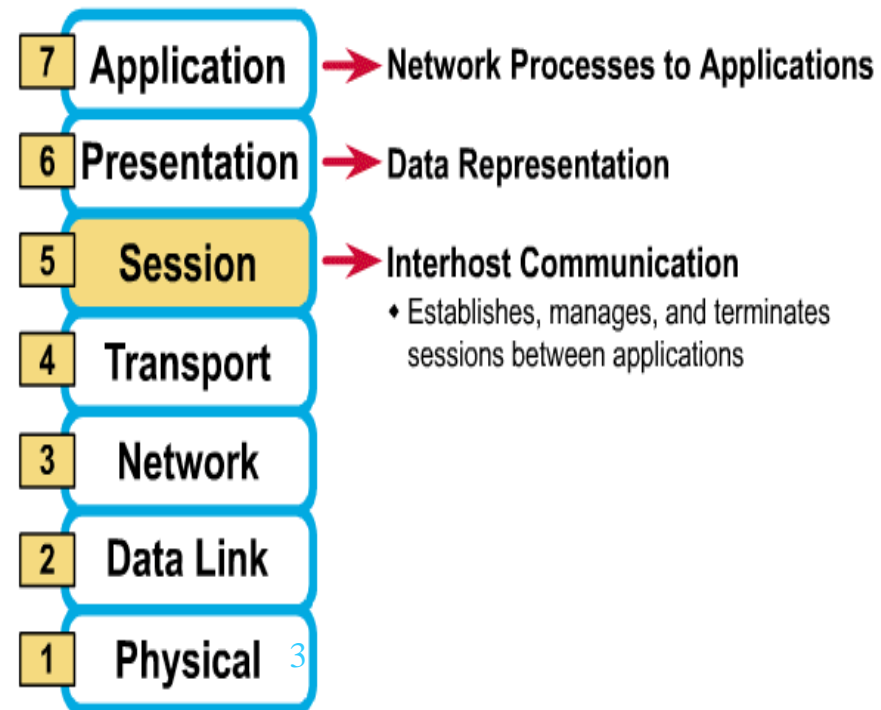

## The 7 Layers of the OSI Model

# Session Layer

- Allows applications to maintain an ongoing session
- Where is it on my computer?
  - Workstation and Server Service (MS)
  - Windows Client for NetWare (NetWare)

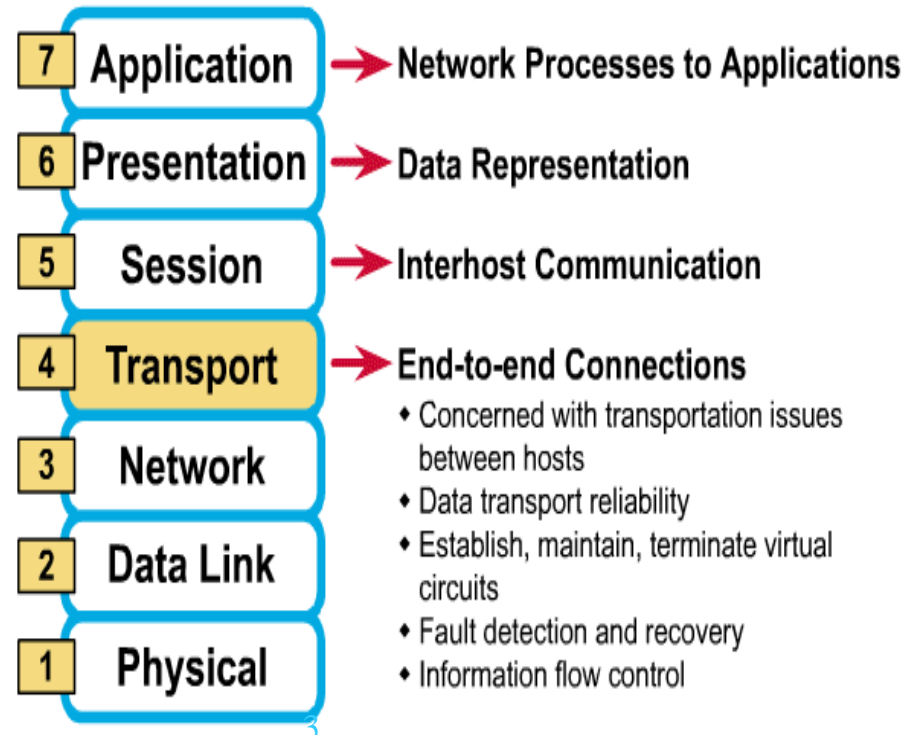

## The 7 Layers of the OSI Model

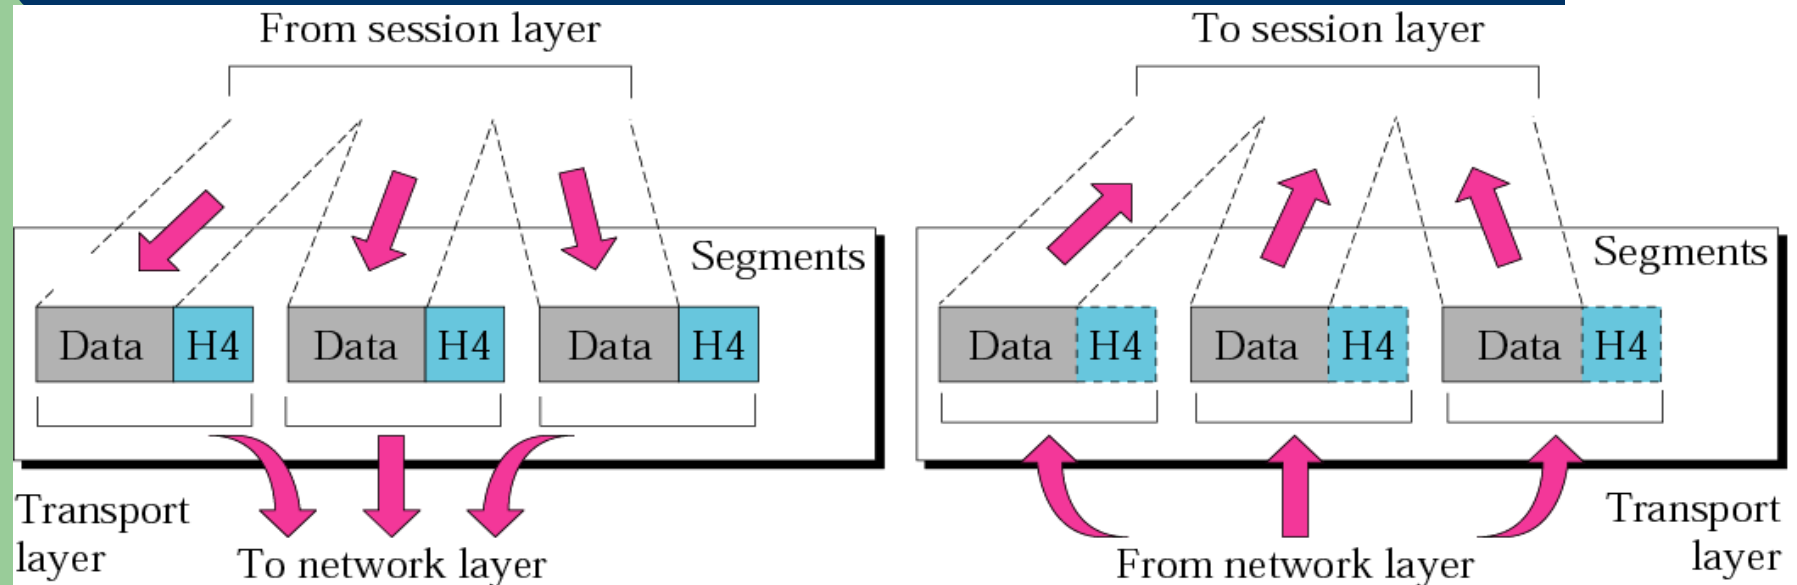

# Transport Layer

- Provides reliable data delivery
- It's the TCP in TCP/IP
- Receives info from upper layers and segments it into packets
- Can provide error detection and correction

## The 7 Layers of the OSI Model

**Figure 2.9** *Transport layer*

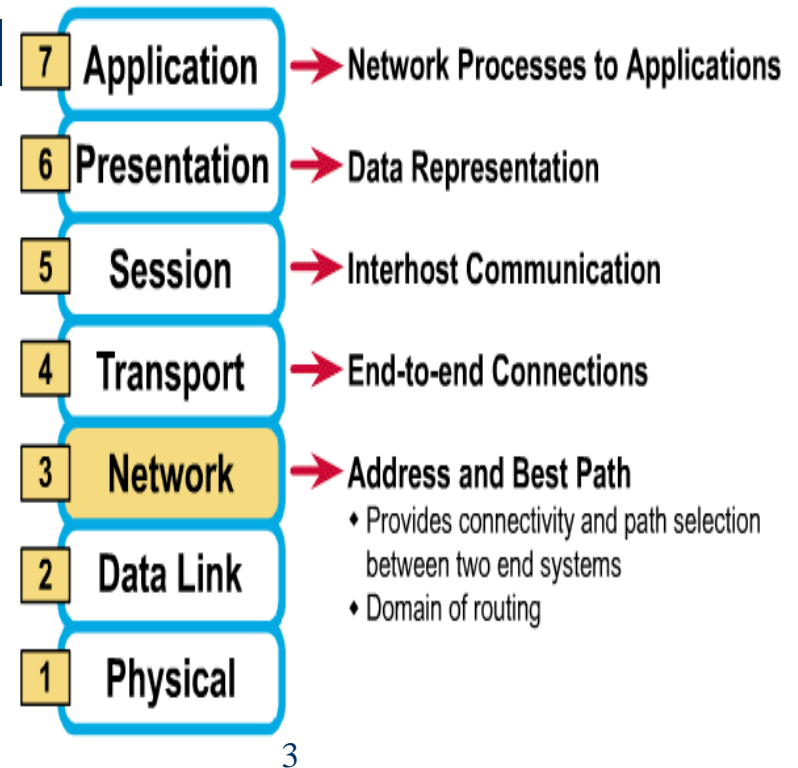

*The transport layer is responsible for the delivery of a message from one process to another.*

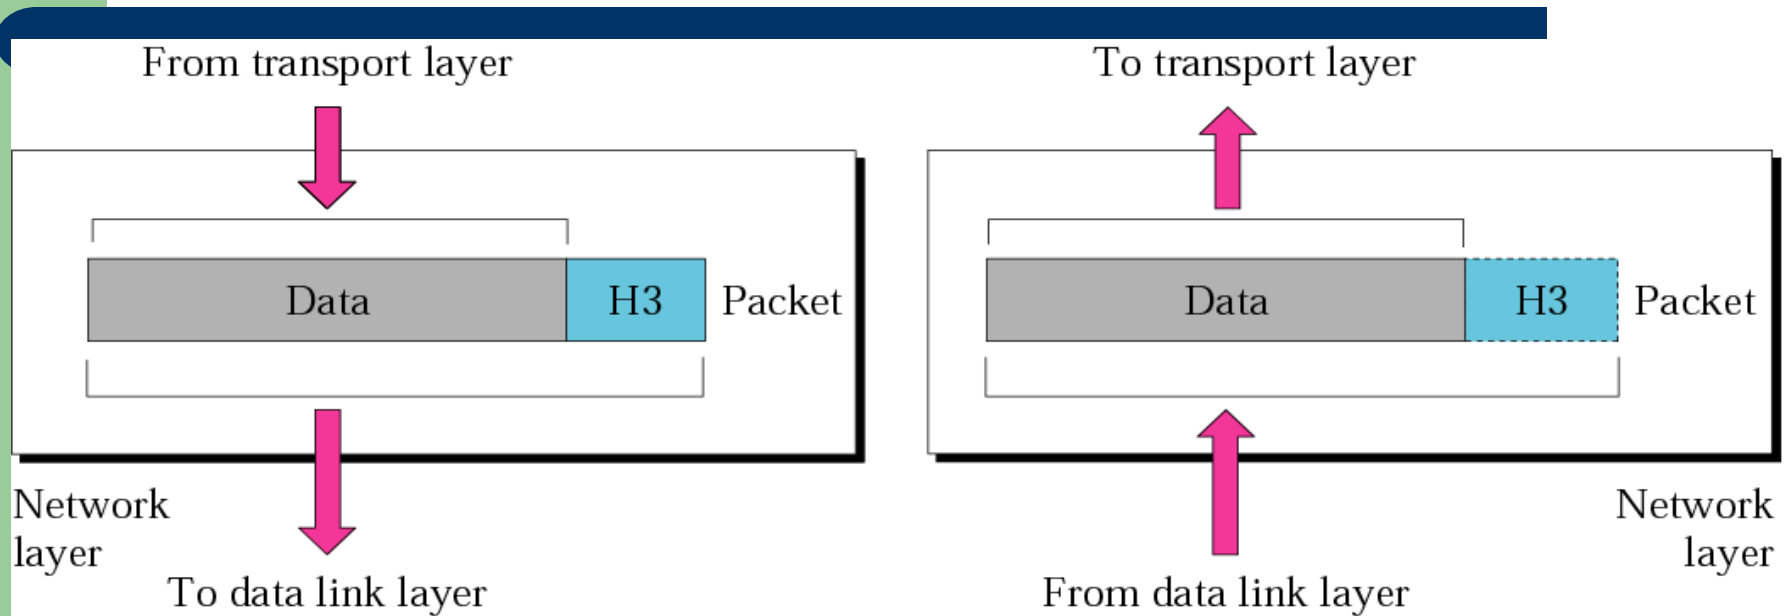

# Network Layer

- Provides network-wide addressing and a mechanism to move packets between networks (routing)
- Responsibilities:
  - Network addressing
  - Routing
- Example:
  - IP from TCP/IP

## The 7 Layers of the OSI Model

## *Network layer*

*The network layer is responsible for the delivery of individual packets from the source host to the destination host.*

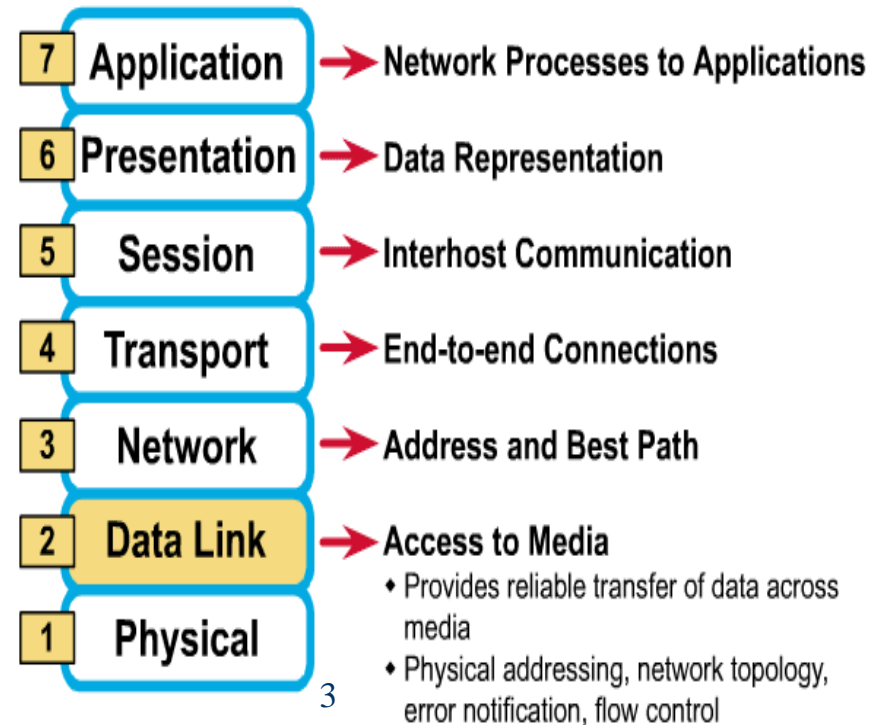

# Network Addresses

- Network-wide addresses
- Used to transfer data across subnets
- Used by routers for packet forwarding
- Example:
  - IP Address
- Where is it on my computer?
  - TCP/IP Software

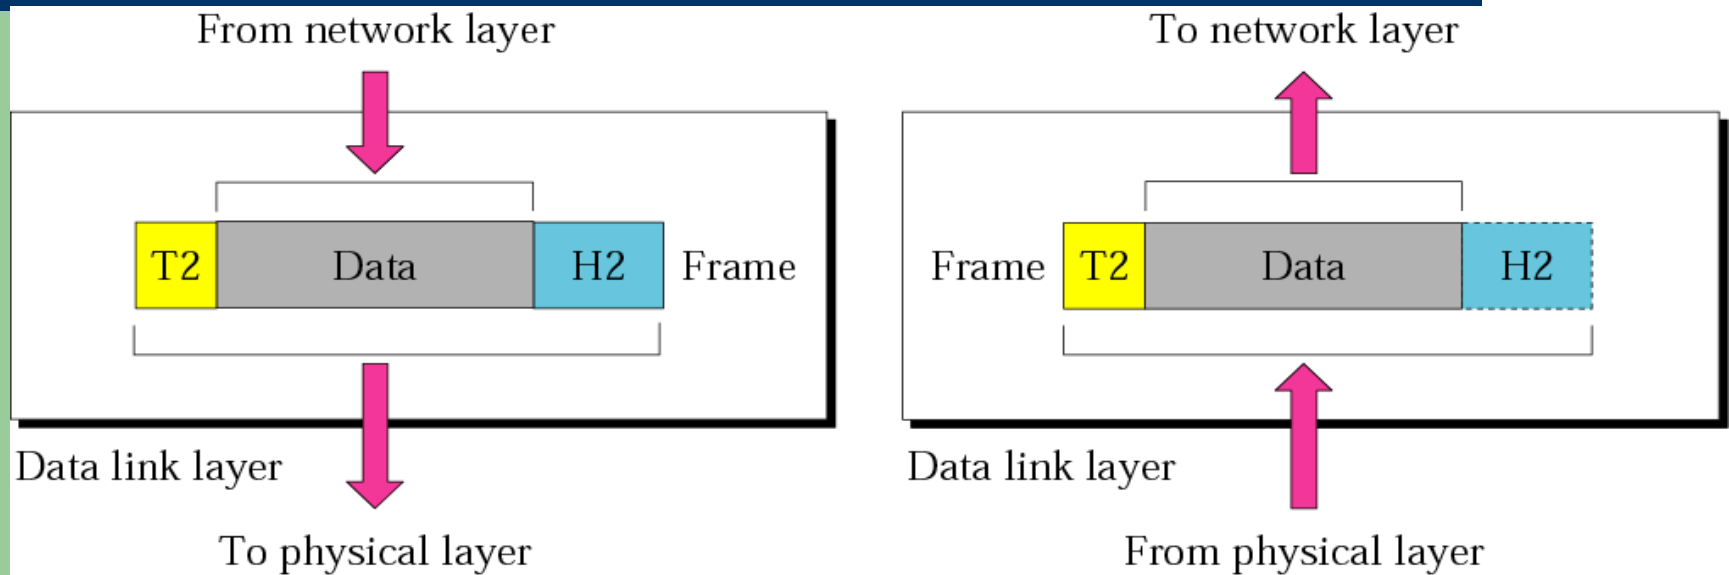

# Data Link Layer

- Places data and retrieves it from the physical layer and provides error detection capabilities

## The 7 Layers of the OSI Model

## *Data link layer*

*The data link layer is responsible for moving frames from one hop (node) to the next.*

# Sub-layers of the Data Link Layer

- MAC (Media Access Control)
  - Gives data to the NIC
  - Controls access to the media through:
    - CSMA/CD Carrier Sense Multiple Access/Collision Detection
    - Token passing
- LLC (Logical Link Layer)
  - Manages the data link interface (or Service Access Points (SAPs))
  - Can detect some transmission errors using a Cyclic Redundancy Check (CRC). If the packet is bad the LLC will request the sender to resend that particular packet.

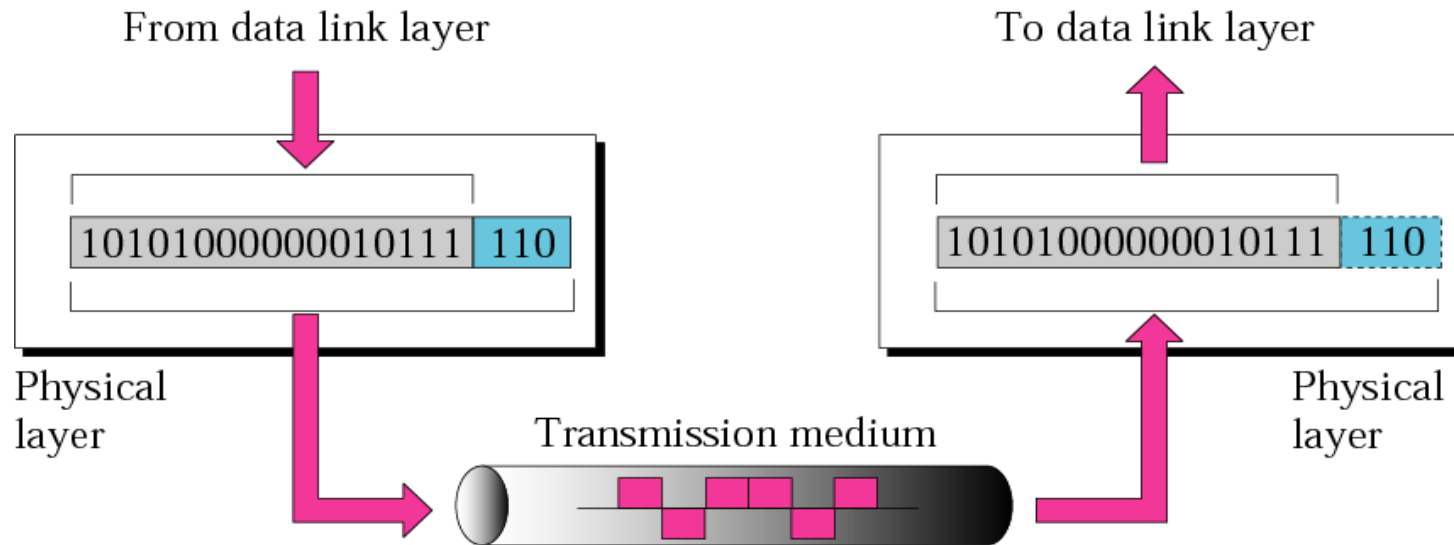

# Physical Layer

- Determines the specs for all physical components
  - Cabling
  - Interconnect methods (topology / devices)
  - Data encoding (bits to waves)
  - Electrical properties
- Examples:
  - Ethernet (IEEE 802.3)
  - Token Ring (IEEE 802.5)
  - Wireless (IEEE 802.11b)

## The 7 Layers of the OSI Model

## *Physical layer*

*The physical layer is responsible for the movement of individual bits from one hop (node) to the next.*

# Physical Layer (cont'd)

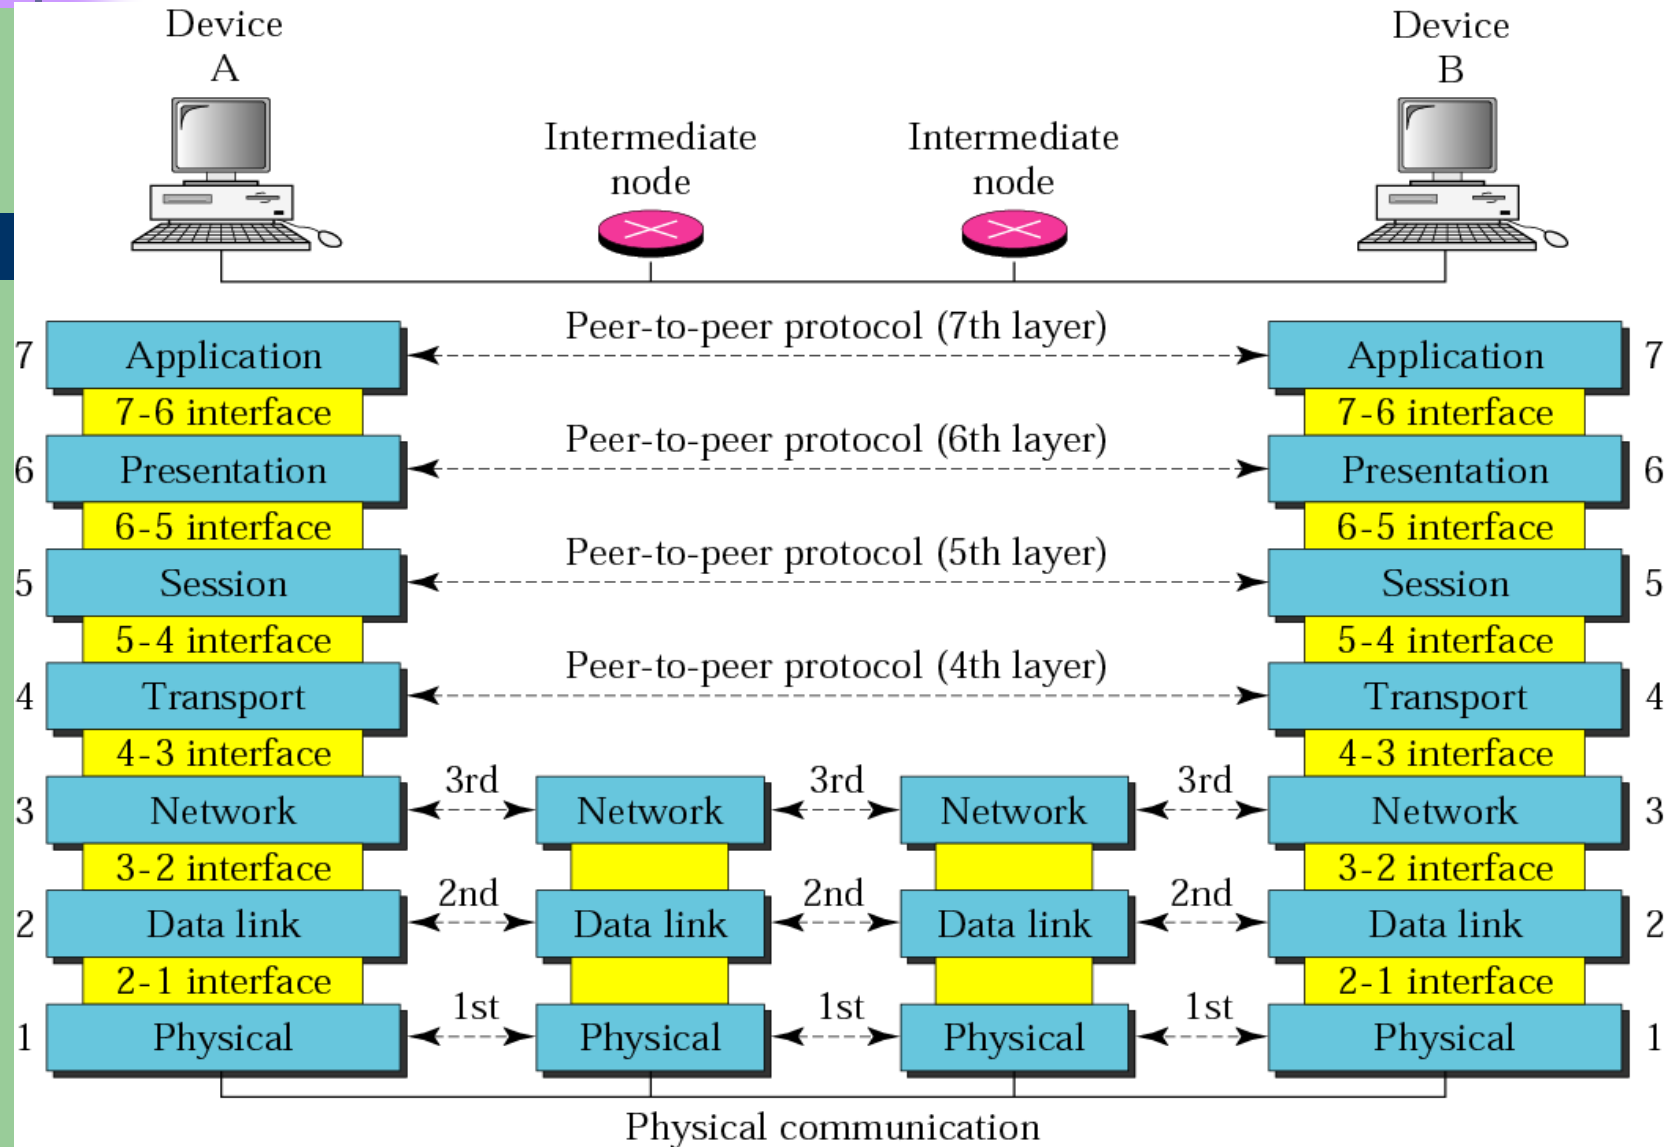

- What are the Physical Layer components on my computer?
- NIC
  - Network Interface Card
  - Has a unique 12 character Hexadecimal number permanently burned into it at the manufacturer.
  - The number is the MAC Address/Physical address of a computer
- Cabling
  - Twister Pair
  - Fiber Optic
  - Coax Cable

# How Does It All Work Together

- Each layer contains a Protocol Data Unit (PDU)
  - PDU's are used for peer-to-peer contact between corresponding layers.
  - Data is handled by the top three layers, then Segmented by the Transport layer.
  - The Network layer places it into packets and the Data Link frames the packets for transmission.
  - Physical layer converts it to bits and sends it out over the media.
  - The receiving computer reverses the process using the information contained in the PDU.

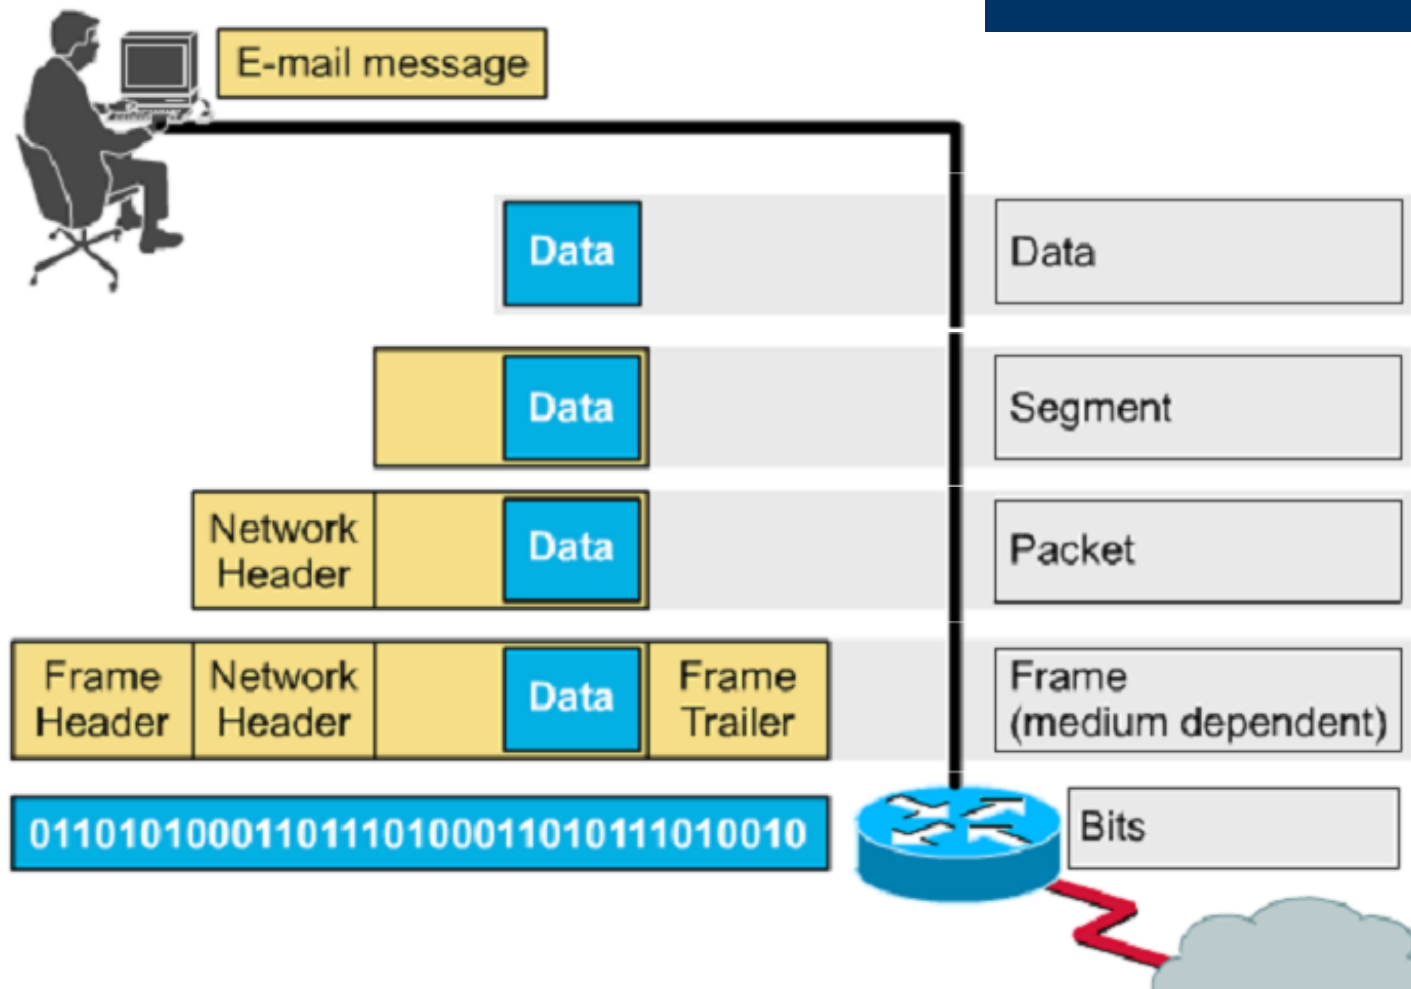

**Figure 2.2** *OSI layers*

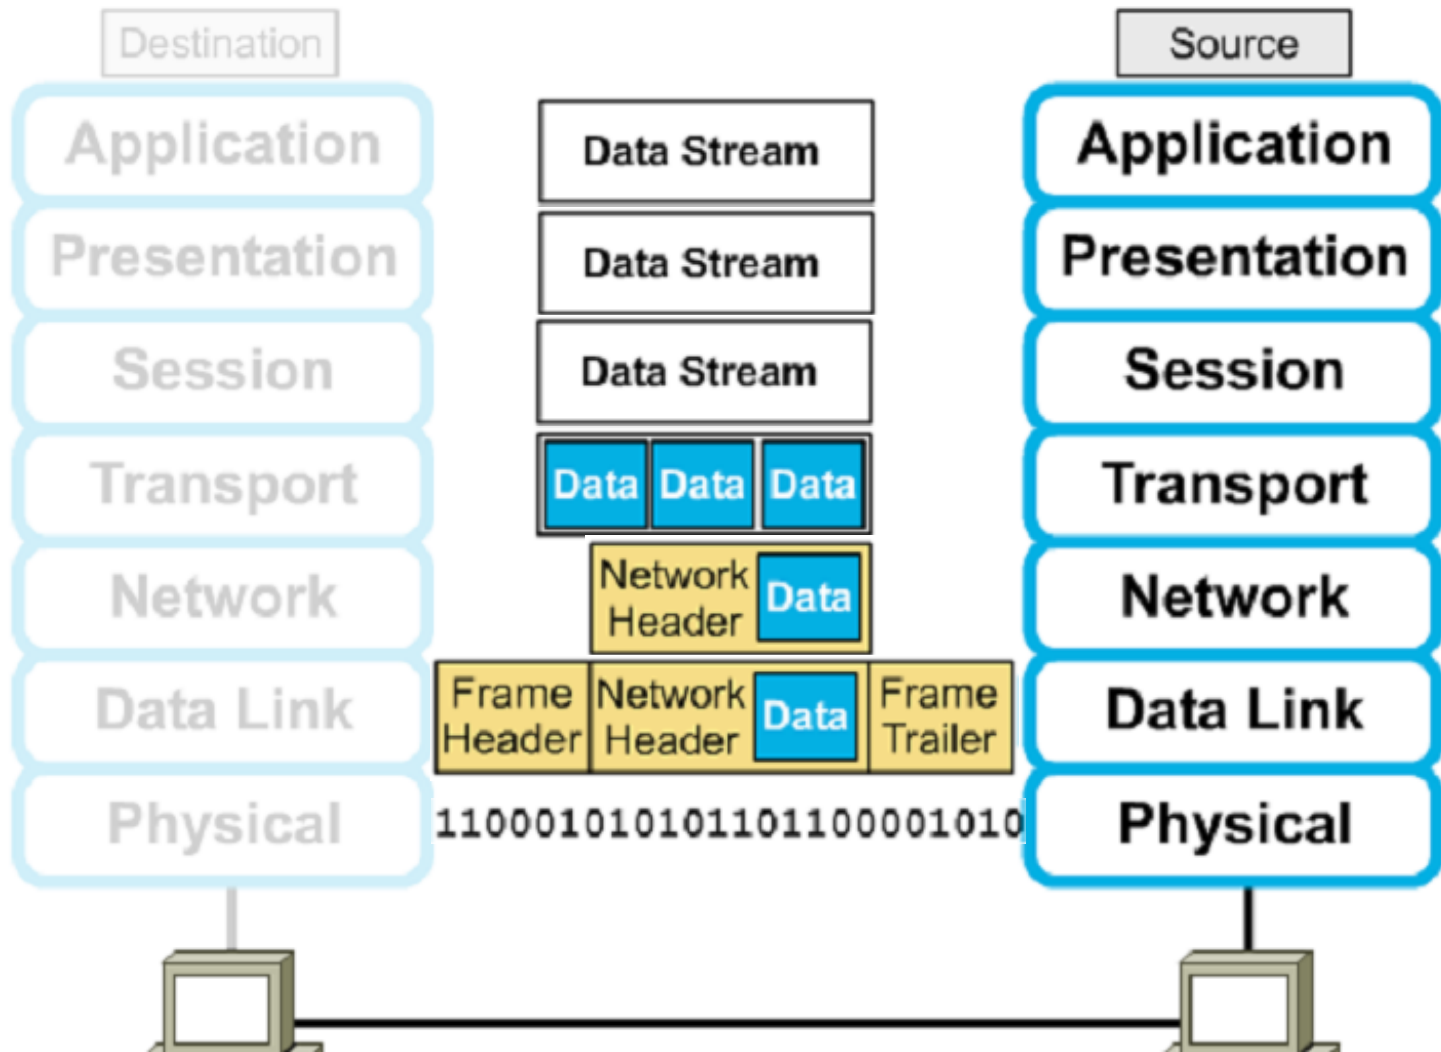

# Data Encapsulation In TCP/IP

- At each layer in the TCP/IP protocol stack
  - Outgoing data is packaged and identified for delivery to the layer underneath
- PDU – Packet Data Unit – the “envelop” information attached to a packet at a particular TCP/IP protocol
  - e.g. header and trailer
- Header
  - PDU’s own particular opening component
  - Identifies the protocol in use, the sender and intended recipient
- Trailer (or packet trailer)
  - Provides data integrity checks for the payload

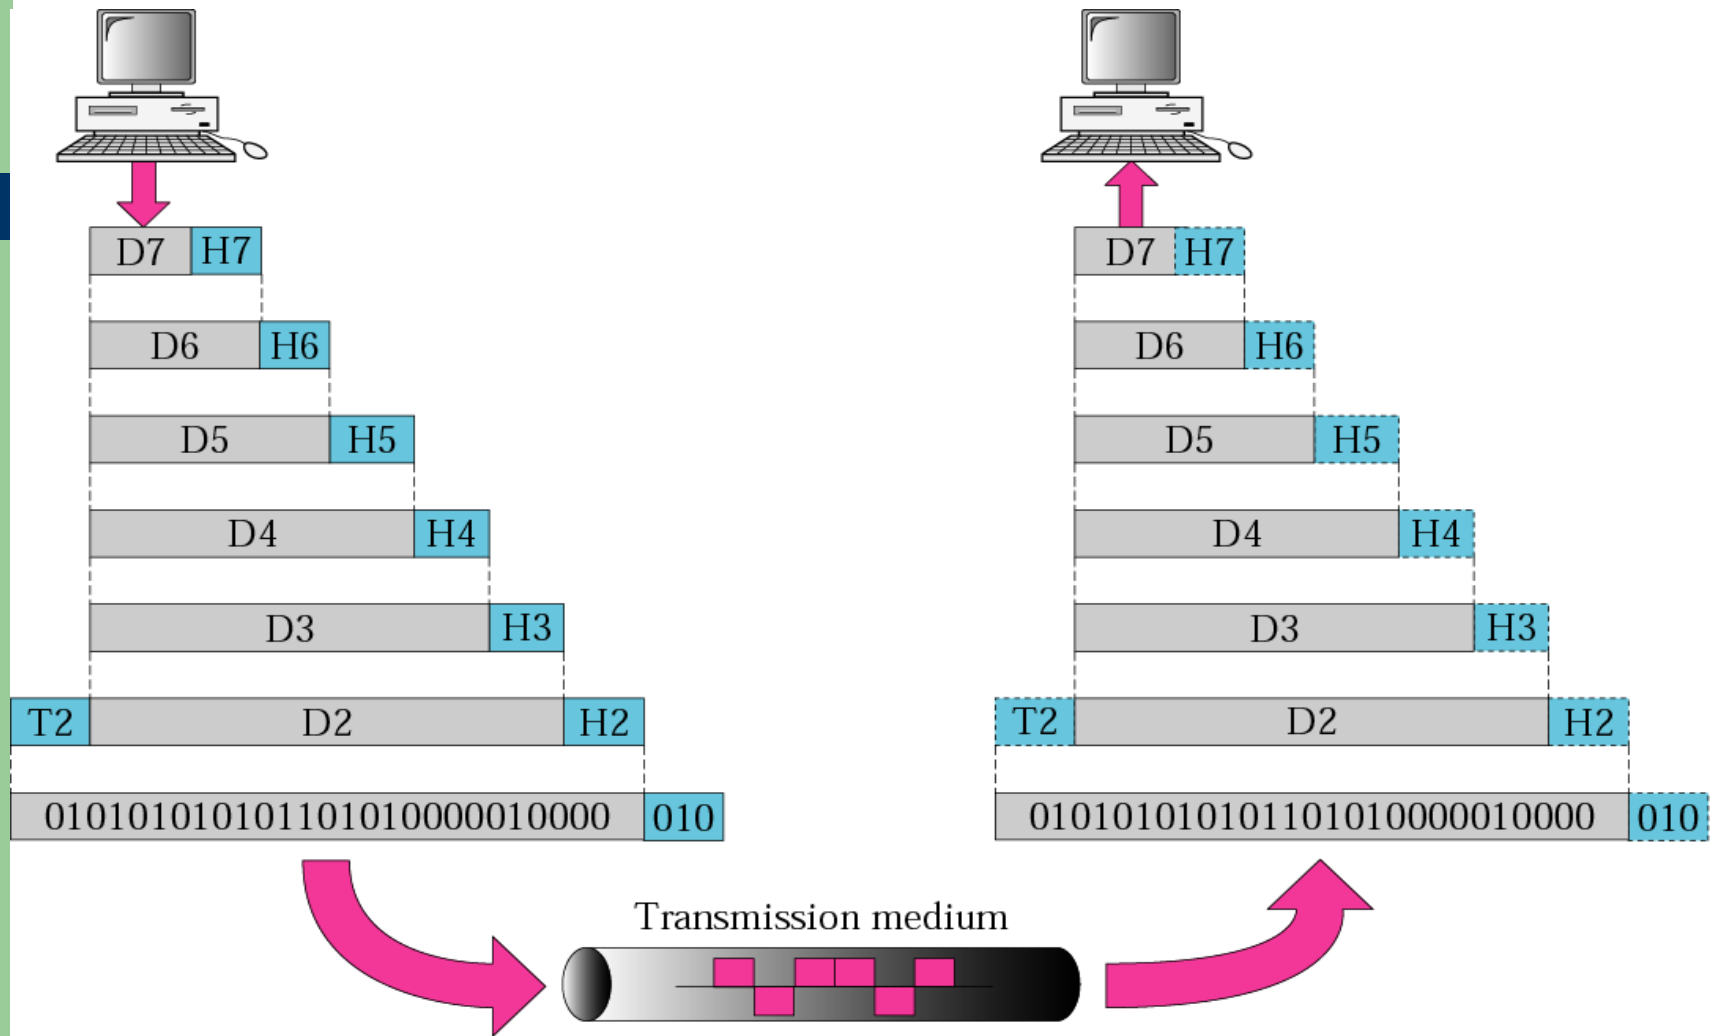

# Encapsulation example: E-mail

# Encapsulation

**Figure 2.3** *An exchange using the OSI model*

**Figure 2.14** *Summary of layers*

# The Postal Analogy

How would the OSI compare to the regular Post Office

Application

- **A-** Write a 20 page letter to a foreign country.

Presentation

- **P-** Translate the letter so the receiver can read it.

Session

- **S-** Insure the intended recipient can receive letter.

Transport

- **T-** Separate and number pages. Like registered mail, tracks delivery and requests another package if one is “lost” or “damaged” in the mail.

Network

- **N-** Postal Center sorting letters by zip code to route them closer to destination.

Data-Link

- **D-** Local Post Office determining which vehicles to deliver letters.

Physical

- **P-** Physical Trucks, Planes, Rail, autos, etc which carry letter between stations.

# Remembering the 7 Layers

7 - <b>A</b> pplication	<b>A</b> ll
6 - <b>P</b> resentation	<b>P</b> eople
5 - <b>S</b> ession	<b>S</b> eem
4 - <b>T</b> ransport	<b>T</b> o
3 - <b>N</b> etwork	<b>N</b> eed
2 - <b>D</b> ata Link	<b>D</b> ata
1 - <b>P</b> hysical	<b>P</b> rocessing

# TCP/IP model development

- The late-60s The Defense Advance Research Projects Agency (DARPA) originally developed **Transmission Control Protocol/Internet Protocol (TCP/IP)** to interconnect various defense department computer networks.
- The Internet, an International Wide Area Network, uses TCP/IP to connect networks across the world.

# 4 layers of the TCP/IP model

- Layer 4: Application
- Layer 3: Transport
- Layer 2: Internet
- Layer 1: Network access

Application

Transport

Internet

Network Access

***It is important to note that some of the layers in the TCP/IP model have the same name as layers in the OSI model.***

***Do not confuse the layers of the two models.***

# The network access layer

- Concerned with all of the issues that an IP packet requires to actually make the physical link. All the details in the OSI physical and data link layers.
  - Electrical, mechanical, procedural and functional specifications.
  - Data rate, Distances, Physical connector.
  - Frames, physical addressing.
  - Synchronization, flow control, error control.

# The internet layer

- Send source packets from any network on the internetwork and have them arrive at the destination independent of the path and networks they took to get there.
  - Packets, Logical addressing.
  - Internet Protocol (IP).
  - Route , routing table, routing protocol.

# The transport layer

- The transport layer deals with the quality-of-service issues of reliability, flow control, and error correction.
  - Segments, data stream, datagram.
  - Connection oriented and connectionless.
  - Transmission control protocol (TCP).
  - User datagram protocol (UDP).
  - End-to-end flow control.
  - Error detection and recovery.

# TCP/IP Reference Model (cont)

- 3. Transport layer (layer 3)
  - Allows end-to-end communication
  - Connection establishment, error control, flow control
  - Two main protocols at this level
    - Transmission control protocol (TCP),
      - Connection oriented
        - Connection established before sending data
        - Reliable
    - user datagram protocol (UDP)
      - Connectionless
        - Sending data without establishing connection
        - Fast but unreliable

# The application layer

- Handles high-level protocols, issues of representation, encoding, and dialog control.
- The TCP/IP combines all application-related issues into one layer, and assures this data is properly packaged for the next layer.
  - FTP, HTTP, SMNP, DNS ...
  - Format of data, data structure, encode ...
  - Dialog control, session management ...

# TCP/IP protocol stack

# Protocols at the transport layer

- Transmission control protocol (TCP),
  - Connection oriented
    - Connection established before sending data
    - Reliable
- user datagram protocol (UDP)
  - Connectionless
    - Sending data without establishing connection
    - Fast but unreliable

# Protocol at the network layer

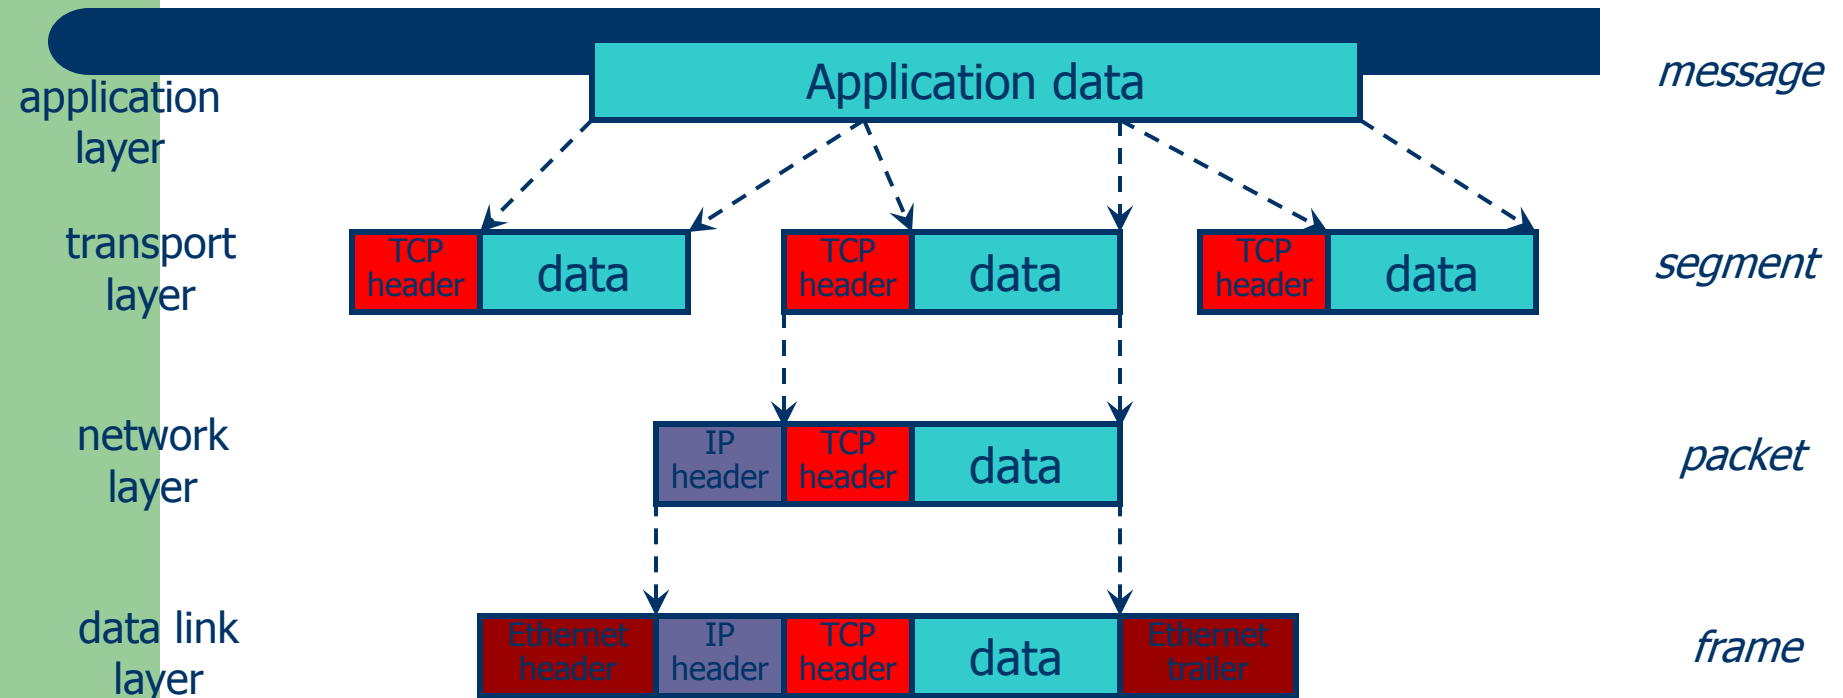

- IP
  - Path selection ,
  - routing and addressing
- ICMP (Internet Control Message Protocol )
  - sends error messages relying on IP
    - a requested service is not available
    - a host or router could not be reached

# Protocols at the link layer

---

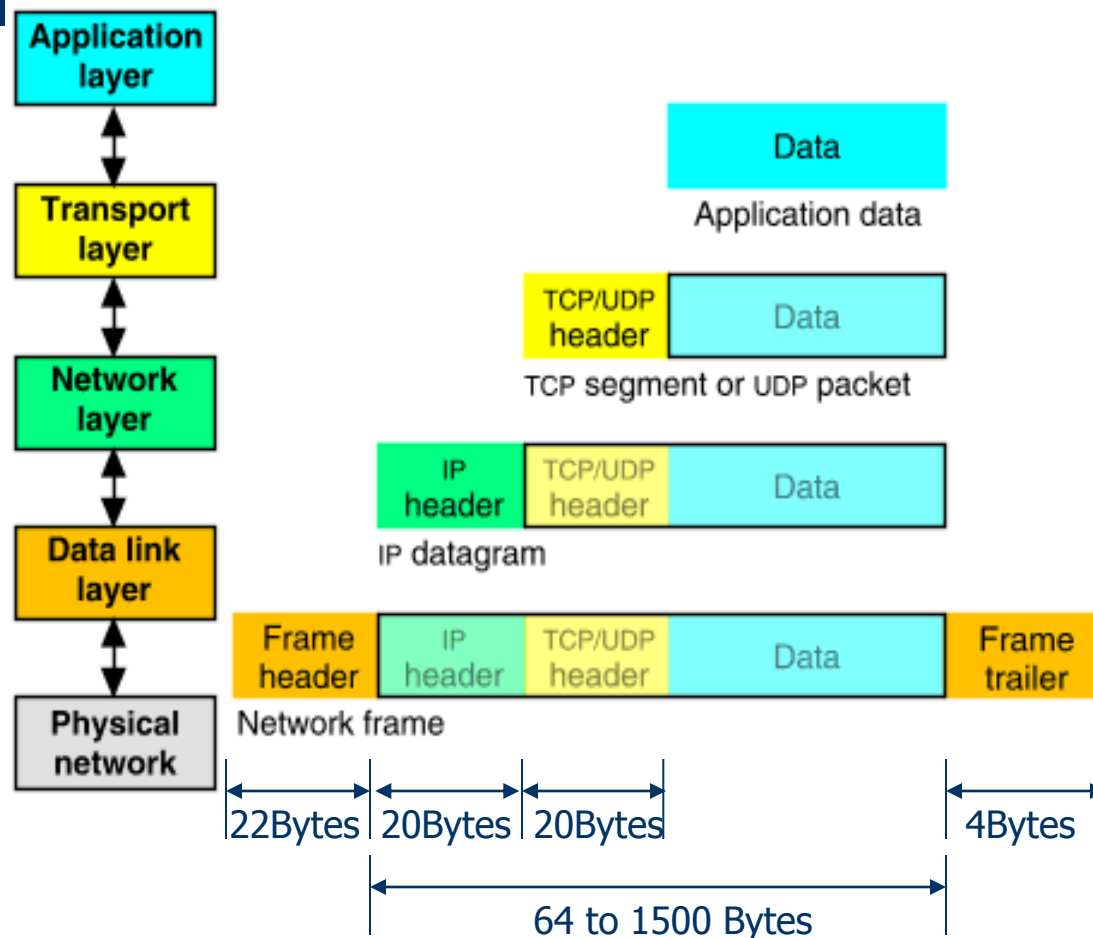

- Ethernet
  - Uses CSMA/CD
- Token Ring

# Data Formats

# Packet Encapsulation (TCP/IP)

- The data is sent down the protocol stack
- Each layer adds to the data by prepending headers

# Comparing TCP/IP with OSI

OSI Model	TCP/IP Hierarchy	Protocols				
7 <sup>th</sup> Application Layer	Application Layer	HTTP	SMTP	POP3	FTP	...
6 <sup>th</sup> Presentation Layer						
5 <sup>th</sup> Session Layer						
4 <sup>th</sup> Transport Layer	Transport Layer	TCP		UDP		
3 <sup>rd</sup> Network Layer	Network Layer	IP				ICMP
2 <sup>nd</sup> Link Layer	Link Layer	ARP RARP Ethernet		PPP	...	
1 <sup>st</sup> Physical Layer						

Link Layer : includes device driver and network interface card

Network Layer : handles the movement of packets, i.e. Routing

Transport Layer : provides a reliable flow of data between two hosts

Application Layer : handles the details of the particular application

# How the OSI and TCP/IP Models Relate in a Networking Environment

OSI Model Layer	OSI Model Name	Pneumonic	Equipment	Equipment Purpose	Data	Protocols	Words to Remember	TCP/IP Model
Layer 7	Application	All	Computer	Regular Computer or A Special Gateway. Used to combine networks using different communication protocols	Data	Redirector, FTP, Telnet, SMTP, SNMP, Netware Core	Browsers	Application
Layer 6	Presentation	People					Common Data Format	Application
Layer 5	Session	Seem					Dialogues and Conversations	Application
Layer 4	Transport	To	Computer		Segment	TCP and UDP	Quality of Service, and Reliability	Transport
Layer 3	Network	Need	Router	Segment Network into Smaller <b>Broadcast</b> Domains	Packet	Routable Protocols. (IP, IPX, AppleTalk)	Path Selection, Routing, and Addressing	Internet
Layer 2	Data Link -MAC -LLC	Data	Bridge (2 Ports) or Switch and NIC	Segment Network into Smaller <b><i>Collision</i></b> Domains	Frame	NDIS, ODI, MAC Address, Ether Talk	Frames and Media Access Control (MAC)	Network Access
Layer 1	Physical	Processing	Repeater, Hub (Multi-port), Cabling	One Collision AND One Broadcast Domain	Bit	Physical	Signals and Media	Network Access

# Internet applications

- TCP/IP takes care of the hard problems
  - Location of the destination host
  - Making sure the data is received in the correct order and error free
- Coding Internet applications
  - Turns out to be straightforward.
- The key concept of Internet programming is
  - The client-server model

# Client-Server model

- Client and server processes operate on machines which are able to communicate through a network:
  - The Server waits for requests from client
  - When a request is received
  - The server lookup for the requested data
  - And send a response the client
- Sockets and ports
  - A socket is and end-point of way communication link between two programs
  - A port number bound to a socket specifies the protocol need the be used at the receiving end
- Example of servers
  - File servers
  - Web servers
- Example of client applications
  - Browsers
  - Email clients

# What is a socket?

- An interface between application and network.
  - Create a socket
    - `Socket(Protocolfamily, type-of-communicatio, specific- protocol);`
  - The application creates a socket
  - The socket *type* dictates the style of communication
    - reliable vs. best effort
    - connection-oriented vs. connectionless

# Ports

- ❑ Each host has 65,536 ports
  - ❑ 20,21: FTP
  - ❑ 23: Telnet
  - ❑ 80: HTTP
- ❑ A socket provides an interface to send data to/from the network through a port

# Protocols

- For a great graphic of protocol stacks in relationship to the OSI model, visit <http://www.lex-con.com/osimodel.htm>
- For more information on the OSI model, including an animated graphic and various protocol information, visit <http://www.certyourself.com/OSIguide.shtml>
